FOREWORD

This year's Saskatchewan Economic Review brings good news for the people of our province.

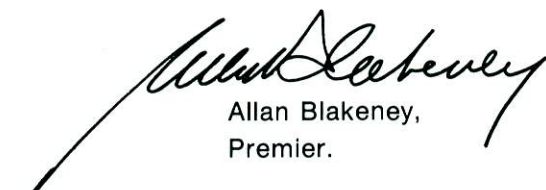

For two years, we have experienced the lowest unemployment rate in Canada and there is reason to believe that this enviable record can be continued.

More people are employed in Saskatchewan today than at any time in our history and it is particularly encouraging that young people in their teens and twenties are an increasing proportion of our work force.

While the general economy of Canada appears to be levelling out, there are strong indications that Saskatchewan's economy will go against the national trend and continue an increased rate of expansion during the next year.

In the past few years, we have made steady progress with diversifying our economy: more and more jobs are being created outside agriculture.

With the prospect for continued good prices for many of our most important primary products, there is every reason to believe that diversification will continue and that Saskatchewan can stay strong and increasingly self-sufficient in the years ahead.

Allan Blakeney,
Premier.

STATISTICAL SUMMARY OF ECONOMIC INDICATORS SASKATCHEWAN

ECONOMIC OVERVIEW AND FUTURE PROSPECTS

THE CANADIAN ECONOMY

During 1973 and the first quarter of 1974 the rate of expansion of the Canadian economy surpassed the previous two years' upsurge in economic activity. But, as 1974 continues, a reduced rate of expansion has begun to appear. The slow-down is related to the accelerating rate of inflation, to the reduced economic activity experienced by many industrial countries, and to restrictive monetary policies recently introduced to combat inflation by restricting aggregate demand.

Both the domestic and world demand for goods, including food products, contributed to economic expansion in 1973. Total output in Canada in 1973 rose by 14.8 per cent over 1972 in value. This amounts to a 7.1 per cent rise in volume of output after price increases are removed, the largest yearly gain since 1956. The comparable annual rate of growth for 1971 and 1972 was 5.8 per cent.

Personal expenditures on consumer goods and services rose by more than 14 per cent in 1973. This was in line with increases in personal disposable income and outstanding consumer credit. Expenditures on durable goods were over 18 per cent above those for 1972. There were strong gains in outlays on furniture and home appliances, concurrent with the housing boom. Expenditures on new automobiles also rose by 21 per cent.

Spending on semi-durable and non-durable goods also rose at unusually strong rates but much of these gains were attributed to increased prices, especially for food.

Increased employment and higher average earnings resulted in a rise of 12.5 per cent in labour income. This contributed to the overall gain in personal income, since wages and salaries account for twice as much as the total of all other components. However all components showed gains, with that for net farm income rising by 86 per cent. Total personal income for the year was 14 per cent higher than in 1972. Total disposable income showed much the same increase.

Economic expansion in 1973 was also reflected in the incomes of corporations. Profits jumped by more than 35 per cent compared to the large gains of 13 per cent in 1971 and 21 per cent in 1972.

Estimated "before tax" profits of industrial corporations were 40.9 per cent higher than in 1972 compared to annual increases of 14.6 per cent and 20.9 per cent in the two preceding years.

Although nearly all industrial corporations had profit increases, mining and manufacturing recorded especially strong gains. Corporations engaged in mining registered an increase of 108.3 per cent collectively. Base metal operations profits rose by 159.4 per cent and fuels by 55.2 per cent.

Manufacturing profits increased by 41.8 per cent with paper, allied and forestry industries showing a rise of more than 200 per cent. Textiles, petroleum refining, metal fabricating and non-metallic minerals all had substantial gains.

A disturbing feature for all industrial countries in 1973 was the accelerating increase in prices for food, for industrial materials and, most notably in the latter part of the year, for petroleum and petroleum products.

For Canada in 1973 the most noticeable overall price increases at the consumer level occurred among food items. In the latter part of 1973, however, price increases for raw materials other than food began to appear in consumer goods and services. Although food prices have continued to rise since the beginning of the year, by July increases in other components accounted for two-thirds the added costs of goods and services to the consumer. The largest portion of the added costs are in manufactured goods. Price increases for basic raw materials are

now being realized fully at the finished goods level. Throughout 1973 prices of non-durables other than food rose by 8.5 per cent; in the first seven months of this year, the increase was over 8 per cent. Durables showed an increase of only 3 per cent in 1973, and more than twice that by July of this year. Also showing substantial increases were costs of machinery and other materials used in most of Canada's leading industries.

The effect of inflation on other countries and measures subsequently taken to combat inflation appear to be directly related to a reduced rate of expansion of the Canadian economy in 1974. The first signs of economic weaknesses were a drop in housing activity and in export demand. The result will be a somewhat lower increase in total output for the year 1974 with the prospect of a more pronounced reduction in 1975, when other sectors of the Canadian economy are experiencing a similar decline in their level of economic activity.

In 1973 housing reached record levels in both dollar value and number of units. A total of 269,000 dwelling units were started and 247,000 units were completed. Outlays for new housing increased by 23 per cent.

In the first quarter of 1974 housing starts in Canada were up by 11.5% over the same period in 1973. However, by the end of June starts were down by 1.8 per cent from the total at the same time last year. Although expenditures for new housing in 1974 are expected to be more than 12 per cent above 1973 figures, starts may drop by as much as 10 per cent. The drop is a result of the move toward a more restrictive money supply and tight credit. Lack of mortgage funds and high interest rates have significantly affected housing construction.

In 1975 it is unlikely that there will be renewed interest in housing construction unless special measures are introduced by the federal government. A slow-down in housing will likely be felt at the production level in housing materials in 1975, even though there appear to be shortages of many of these materials at the present time. The increase in the level of retail trade related to durable goods such as outlays for new furniture and household appliances, which has been a characteristic of the Canadian economy over the past three years, can also be expected to decline throughout the balance of 1974 and in 1975 as a result of the decline in housing.

Another major source of weakness — export demand — has already begun to influence production levels in Canada. The value of exports of goods and services rose by almost 24 per cent in 1973, due largely to strong increases in commodity prices. Imports of goods and services in volume grew twice as rapidly as exports. Many of Canada's imports are in the form of manufactured goods which do not immediately reflect the increased prices of raw materials. In value, therefore, imports rose by a slightly lower amount, resulting in a small decline in the deficit on all transactions in goods and services.

Although the value of exports of goods for the first six months of 1974 was 23 per cent above that of 1973 and provided a small surplus in trade for the period, the volume declined by 8 per cent. Lumber was one of the items associated with the decline due to the drop in housing in the U.S. Several Canadian manufacturers have reduced their lumber production because of this fact.

Another area where decline in export levels has been experienced is in automobiles and automotive parts. The rising fuel costs along with a general economic slowdown in the United States has reduced the sales of Canadian manufactured automobiles and parts in the country which constitutes the largest importer of these items. Because the demand for American automobiles remains high in

Canada, the automotive trade deficit with the U.S. is expected to be over \$1 billion this year. Despite a decrease in sales in new passenger automobiles sold in Canada of almost 4 per cent in the first six months of 1974 over the same period in 1973, production at the present time remains at capacity levels because the decrease has been in vehicles manufactured overseas. In 1975 a continued decline in automobile exports and possible decreases in domestic sales may have a significant effect on production, however.

Accompanying the expansion of the economy in 1973 was the associated creation of 430,000 new jobs. This was an increase in employment of 5.2 per cent over the level of 1972, the highest rate of growth in any year recorded. There was also a record increase in the labour force, the result of a larger number of people of working age population and increasing participation of these people. Nonetheless, new jobs outnumbered new entrants, and unemployment dropped from 6.3 per cent in 1972 to 5.6 per cent in 1973.

The rate of unemployment will be higher in 1974 than in 1973. The labour force will, however, continue to show large increases for both 1974 and 1975. With the slower growth in the overall economy it may not be possible to create enough new jobs for the new entrants to the labour force. This, added to unemployment resulting from reduced production in some industries (e.g., lumber), may push the rate of unemployment up to 7 per cent in 1975.

In 1973 there were growing scarcities of materials, in-

THE SASKATCHEWAN ECONOMY

Saskatchewan shared in the upsurge of economic activity experienced by Canada as a whole during 1973. Although certain areas of Canada may expect a significant slow-down in economic expansion in the last half of 1974 and in 1975, the economic outlook for Saskatchewan during this period appears bright.

An encouraging result of the province's buoyant economy in 1973 was the slowing of the rate of population decline. More opportunities locally tended to keep job seekers within the province. Employment rose to an average of 345,000 in 1973, with 8,000 additional jobs created. As a result, population decline was at a level less than half of that between 1969 and 1970. Continued expansion of the economy will mean even more work opportunities next year. It is expected that 1974 will see the reversal of population decline and that by June 1975, Saskatchewan can expect a modest increase in total population, with a larger proportion of young adults remaining in the province.

All sectors of the economy in 1973 showed gains far greater than those for a number of years in spite of rapidly rising costs of production. An important indication of this expansion was the net value of all commodity production which rose to \$2,600 million, an increase of almost 50 per cent. Agricultural production accounted for more than half the total amount, but the production of non-agricultural goods also showed an extraordinary gain of more than 23 per cent.

In 1973 agriculture again played a leading role in the economic performance of the province. Cash receipts in agriculture totalled \$1,469 million, with both field crops and livestock showing record gains despite reduced deliveries of wheat and lower marketings of livestock. Farm prices for agricultural products rose by 54 per cent in 1973. Farm input costs also increased, but this was the first year since 1961 that the price index for farm products showed a greater increase than the index for the cost of production.

Farm expenses in Saskatchewan increased by 20.6 per cent to total \$803 million. Realized net income, that is, income to the farmer after expenses, but not including inventory changes, amounted to \$769 million.

The high cash flow to farmers for grain and livestock will continue throughout the balance of 1974 and into 1975. Although crop prospects are not as good as had been

creasing delivery delays and rising order backlogs. Many industries had reached full capacity levels. Business investment during the latter 60's and early 70's had not provided the necessary facilities to meet 1973 production requirements. There was, however, a substantial increase in non-residential investment by the private sector over 1972. Despite shortages of materials and skilled labour, expenditures on construction rose by 16 per cent, on machinery and equipment by 15 per cent.

The outlook for business investment in 1974 and 1975 indicates strong increases because intentions for new construction and machinery were made when the economic outlook appeared optimistic and when there was extreme pressure on capacity. Supply shortages and tight credit may delay investment committed for 1974 in certain sectors, but total investment by manufacturing industries will still increase by 28 per cent over 1973. In 1975 there should be even greater investment by the business sector.

In summary, with the exception of capital formation by private business, the period of rapid expansion which characterized Canada's economy since 1971 appears to be levelling off in 1974. In an effort to reduce the rate of inflation in Canada and abroad, traditional measures have been adopted which slow the economy. Economic weaknesses can already be identified in areas such as housing and the export market. The economic slow-down will likely continue into 1975, with real growth rates of 4 per cent expected in 1974 and still less in 1975.

hoped for, a strong market still remains for grain sales with accompanying high prices. Livestock sales, too, will bring high returns, although increased beef output in Canada and the United States have weakened cattle prices. Nonetheless, cash receipts could be above last year's level by as much as 50 per cent. With lower inventories, there will likely be reduced sales of agricultural products in 1975. However, expenditures, which have risen rapidly, will level off and farmers will still realize higher-than-average incomes.

Manufacturing activity, particularly in the area of processing farm output, showed encouraging signs in 1973. Shipments of food and beverages manufactured in Saskatchewan accounted for 45 per cent of the value of shipments of all manufactured goods. About three-quarters of the food industries are based on agricultural production. Value of shipments of goods manufactured in Saskatchewan reached \$800.3 million, an increase of 24 per cent over 1972. Investment in construction of new facilities was 50 per cent higher in 1973 than in 1972. In 1974, manufacturing has steadily expanded. The value of shipments for the first half of 1974 exceeded the previous year's total for the same period by 28 per cent. Investment in new facilities for manufacturing in 1974 will be more than 70 per cent above last year's total.

The value of minerals also showed a large gain of 26.0 per cent to reach \$539.3 million in 1973. Prices were higher for all products of Saskatchewan mines. The volume of potash produced in the province showed a significant increase, with the result that the value of this mineral accounted for more than 36 per cent of all mineral production, even though there were somewhat lower price increases for potash than for other minerals.

Mining will continue to show an increased rate of expansion over the next two years. With world demand for fertilizers increasing, potash production restrictions have been removed. It is expected shipments will be approximately seven million tons in 1974 and may exceed this amount in 1975. Prices for potash have been rising and there is no indication of a reduction at this time.

The major change in the metals industry will be the increased production of uranium. With dwindling supplies of petroleum, interest in nuclear energy has been increased. The price of uranium has begun to increase with no let up in sight. Production in 1975 will be stepped up

with the opening of Gulf's mine at Wollaston Lake and with Eldorado's new operation at Uranium City. With these new ventures other sectors of the economy will benefit. By next year the work force at Uranium City is expected to increase substantially above its present number of 400, and to increase still further in 1976.

Total investment involving all construction and machinery and equipment in 1973 rose to \$1,319.9 million, 14.5 per cent above the total in 1972. Expenditures for construction increased by 19 per cent. Outlays for new housing accounted for the largest increase, although new construction in manufacturing and the trade, finance and commercial sectors each increased by more than 50 per cent. Investment in new machinery and equipment alone was 12 per cent above that in 1972. New machinery purchased by farmers amounted to \$247.4 million in 1973, an increase of 32 per cent over 1972 expenditures. This total represented almost 58 per cent of all expenditures on new machinery and equipment last year.

Capital expenditures on construction in 1974 are expected to reach \$662 million. The commercial sector has made a major contribution to investment in this area, with large shopping centres and motels. With additional construction carried out by the public sector, 1975 should see a large increase in construction. Prices of building materials are expected to level off so that the growth will be in volume more so than value.

In addition, there was more activity in housing construction during the first six months of this year than over the same period of 1973. This may have resulted from expectations of higher mortgage rates which have recently been realized. Consequently, starts will probably drop during the second half of the year and the total will not likely reach last year's level. Completions, however, should be high. Developments in the north, planned public housing and home ownership assistance programs are expected to result in renewed activity in housing again in 1975. Industrial development taking place in Saskatchewan is also creating the need for more housing. For example, plans call for at least fifty new homes to be built in Hudson Bay, a requirement relating largely to a new plywood operation located there.

The economic expansion of Saskatchewan evidenced in 1973 and, in particular, increased cash flow to farmers, resulted in higher employment and income levels throughout the year.

Personal income rose by 27 per cent to \$3.45 billion in 1973. This was the result of higher employment, wages, investment income and sharply increased farm income. Labour income totalled \$1,620 million, 9 per cent above

that in 1972. Net farm income rose by 113 per cent after having declined in the previous year. This component includes the value of changes in inventories held on farms and, consequently, not all of the amount was available for spending or investment.

The increase in personal income was reflected in consumer expenditures. Retail trade rose by 14 per cent to a total of \$1,459 million in 1973, with automobile dealers and department stores experiencing exceptionally large gains in the value of their sales. Additional expenditures for services last year were indicated by increased employment in trade, finance, insurance and real estate, and business and personal services. As in all of Canada, there were shortages of goods and skilled labour. Had these shortages not existed, outlays would have been higher.

The labour force grew by 6,000 persons in 1973. The increase was largely due to greater participation in the labour force, more especially of people in the younger age groups. Participation for those under 25 years of age increased from 51.7 per cent in 1972 to 54.4 per cent in 1973.

Unemployment levels for the group under 25 dropped to 6.3 per cent, equal to that in 1969 when their number in the labour force was 17,000 less than that of 1973. Average unemployment in Saskatchewan was 3.6 per cent in 1973 compared to the previous year average of 4.3 per cent. Saskatchewan had the lowest unemployment rate in Canada in both 1972 and 1973.

In 1974, Saskatchewan has experienced further increases in the labour force, with almost full employment. In fact, shortages of skilled labour are responsible for slowing the rate of expansion the province would otherwise realize. The average labour force is expected to increase by 3,000 or 4,000 people in 1974 and by a similar number in 1975. The annual unemployment rate should be below the 3 per cent level for 1974 and continue to be favourable in 1975. A large number of young people who have entered the labour force in 1974 are already, or will become, employed in the province and the same can be expected in 1975. This will, in turn, have a stabilizing effect on Saskatchewan's population.

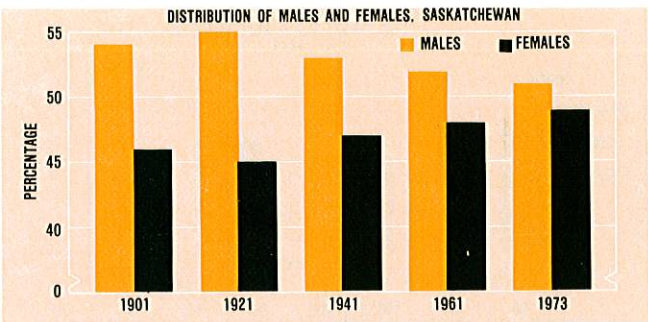

In summary, Saskatchewan will continue to experience an increasing rate of economic expansion in 1974 and 1975 that was characteristic of the 1973 economy. Much of the expansion will depend on continued strong world demand and consequent high prices for raw materials, particularly for agricultural goods. However, steady increases in other sectors of the economy such as mining and manufacturing are indicated. Employment, investment and income levels should remain high in 1974 and 1975.

SELECTED STATISTICS

SASKATCHEWAN

1971 CENSUS

All data in this section were obtained from Statistics Canada's CENSUS OF CANADA, 1971 either in published or unpublished form.

In the 1971 Census all figures have been subjected to "random rounding." This prevents the possibility of associating data with an identifiable individual.

Due to the "random rounding" procedure, figures may not add to totals.
